SUMMARY

Senior DevOps / Cloud Engineer with 5 years of hands-on experience in Linux, cloud infrastructure, infrastructure automation, network automation, CI/CD, Kubernetes, and observability. Skilled in Ansible, AWS, Jenkins, Terraform, Docker, Kubernetes, Python, Bash, Prometheus, Grafana, Alertmanager, and Git. Experienced in leading infrastructure automation and platform migration initiatives, managing production environments, modernizing legacy platforms, implementing monitoring and alerting, and driving EOL remediation. Strong background in troubleshooting complex production issues and building reliable, scalable, and highly automated infrastructure solutions.

SKILLS

Operating Systems: Linux (SUSE, RHEL, Ubuntu)

Cloud: AWS (EC2, S3, Lambda, CloudWatch, IAM, VPC), GCP

Automation & IaC: Ansible, Terraform, Chef, Jinja2, Python, Shell Scripting

Containers & Orchestration: Docker, Kubernetes, Helm

CI/CD & Collaboration: Jenkins, GitHub Actions, Bitbucket, Jira, Git

Monitoring & Observability: Grafana, Prometheus, Alertmanager, ELK, CheckMK, Shinken, Nagios, Dynatrace, Datadog

Other: Infoblox, LDAP, SELinux

EXPERIENCE

DevOps Engineer

Rakuten

Dec 2025 – Present

- Migrated enterprise Ansible platform from 2.7 to Ansible Core 2.18, reducing playbook failures by 30%.
- Standardized Grafana dashboards and alerting across large-scale network infrastructure, cutting alert noise by 25%.
- Improved monitoring coverage on Grafana and Prometheus across 3,000+ devices, closing alerting gaps and reducing missed incidents by 20%.
- Automated multi-vendor network operations using Ansible and Python, cutting manual change effort by 25-28%.
- Executed production EOL remediation and platform modernization with structured pre/post validation, reducing rollback incidents by 20%.
- Troubleshot Jenkins pipeline failures – build-agent issues, credentials, dependencies, deployment failures – improving pipeline success rate by 25%.
- Designed and maintained Jenkins CI/CD pipelines, reducing deployment cycle time by 20%.
- Templated network operations using Jinja2, Ansible, and Python, cutting manual configuration errors by 25%.
- Migrated monitoring from Shinken to CheckMK, closing out a long-pending EOL project and improving alert accuracy.
- Introduced a Terraform-based approach to onboard devices, cutting onboarding time from days to hours.
- Cut incident MTTR from hours to minutes by pairing improved alerting/observability with automated remediation playbooks and NOC runbooks.

Senior System Administrator

Tata Consultancy Services

May 2022 – Dec 2025, Bangalore, India

- Working on a project for SAP
- Streamlined patch management for 3,100+ Linux machines every month, cutting vulnerability counts by 30% and keeping the environment aligned with IT security policy.
- Brought Infrastructure-as-Code practices (Ansible/Chef, Terraform) into the team, cutting deployment time by 75% and making configuration consistent across 2,500+ servers.
- Worked closely with the DevOps team on CI/CD so code pushes stopped causing downtime.
- Migrated Linux auth from local passwords to LDAP, which improved admin efficiency by about 25%.
- Automated infrastructure provisioning with CloudFormation and Terraform, cutting deployment time by 40%.
- Led a 5-person team through migrating 300+ legacy systems to the cloud – 35% cost reduction and better scalability out of it.
- Part of a 24/7 on-call rotation, keeping systems up through both peak and off-peak hours.
- Rolled out Nagios-based network monitoring that cut disruptions by 35% and saved roughly \$250,000 a year in operational cost.
- Ran a centralized McAfee antivirus deployment across all 3,100+ Linux machines, cutting malware incidents by 40%.
- Automated daily cron jobs for routine maintenance, saving each engineer about 2 hours a day.
- Designed and deployed highly available AWS architectures (EC2, Auto Scaling, Load Balancers) for clients.
- Built serverless automation with AWS Lambda for data processing and scheduled/trigger-based workflows, wired into S3 events and CloudWatch.
